FIRE RESISTANT DRYWALL
on your entire house.

5/8" FLAME CURB®TYPE X

Dear Valued Customer,

It may look just like regular drywall, but these panels are even more effective against fire than regular drywall. Fire resistant drywall is a specialized product having a gypsum core containing glass fibers and other non-combustible materials.

This type of wallboard is designated Type X by the industry material spec ASTM C 36. According to the ASTM specifications, Type X drywall must present: at least 60 minutes of fire resistance for 5/8" board. This may make the difference between one room burning or your entire house.

Best regards,

Victor Romero
